### **Product Description**

The Griptec® system is the most accomplished reinforcing bar end preparation process to-date:

- Effortless: factory-made threaded sleeves are fixed onto the bar ends by a fully-automatic extrusion machine.
- Safe: the CE-compliant, fully-protected extrusion machine doesn't allow access to mobile parts when it is in use.
- Mistake-free: the Griptec machine auto-adjusts its processing parameters when switching from one bar size to another.
- Controlled: the Griptec machine automatically performs a tensile pull on each and every connection that is manufactured.
- Fast: each bar end preparation takes only about 30 seconds.
- Clean: no dirty oil coolant or machining chips.
- Handy: parallel threads do not require a torque wrench for site assembly.

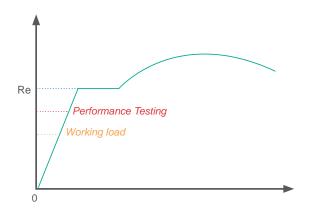

The Griptec® system guarantees an ultimate tensile strength greater than bars, up to 700 MPa.

### No room for error: Systematic proof-testing of each and every bar end produced !

Load testing of the bar end is an integral part of the Griptec® bar end preparation process.

This is a non-destructive test: The tensile load is less than the nominal yield strength of the bar, typically at 90% of Re (70% for dia 40 up), by which 100% of the bar ends are tested at a load higher than their design working load.

The Griptec® system doesn't apply to smooth

Bar end preparation must be done exclusively with machines provided by Dextra. Consult us for technical details of our range of machinery (please specify the minimum and maximum bar diameters that you need to process).

Griptec® couplers and anchor plates can be epoxy-coated by any means. Their internal threads must be protected before processing.

The surface condition of Griptec® couplers and anchor plates conforms to ACI 318 (2008) § 7.4.2, ACI 349 (2006) § 7.4, ASME Section III Division 2 § CC-4360 and B.S. 5400 Part 7 § 4.5. Weldable couplers furthermore conform to ANSI/AWS D1.1-88 § 3.2.1.

## **About Griptec®**

The Griptec® mechanical splice system consists of threaded sleeves that are fixed onto the reinforcing bar ends. A combination of male and female sleeves creates the connection. The GRIPTEC® system uses isometric parallel threads, so its mechanical performance in compression equals that in tension.

Female sleeves are generally used on first-phase bars, in order to ease the closing of the formworks. Male sleeves are generally used on continuation bars. However pocket formers are available when male sleeves are used in first place bars.

For all types of connections, the preparation of the reinforcing bar is the same : either a female or a male sleeve is swaged onto the end of the bar by deforming the material of the sleeve so that it interlocks intimately with the ribs of the bar.

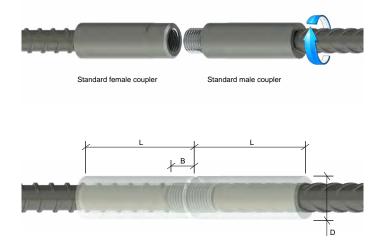

Standard splices use nothing else than a female sleeve and a male sleeve.

Other types of connections use additional elements, which combine with the male and female sleeves in order to achieve the function sought. The product codes of the male and female sleeves are given at the Standard Splices section. In the other sections, only the product codes of the additional elements are given ; the sleeves must be purchased as per the product codes given in the Standard Splices section.

### **Standard Splices**

Standard Griptec® splices are accomplished by use of a standard female coupler and a standard male coupler of the matching size.

Table 1: Dimensions of Griptec Standard splices.

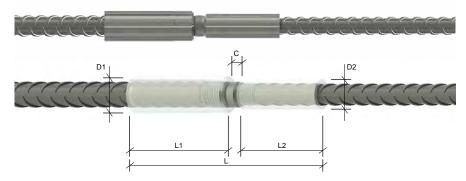

Note: B is the distance between the face of the sleeve and the end of the bar inside the sleeve. The values of B and L are indicative, as they depend on the actual dimensions of the bar, its ribs and the shape of the cut.

# **Transition Splices**

When there is a need to splice bars of different sizes, the Griptec® connects two standard female sleeves with a two-stepped threaded stud.

STEP3 Use a pipe wrench on the continuation bar to lock the splice.

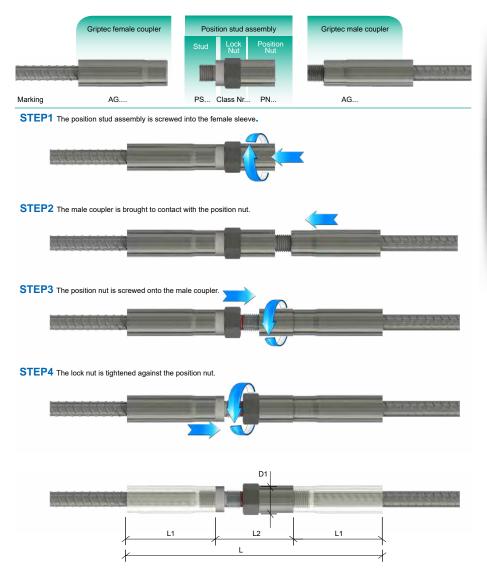

### See Assembly instruction n° AI-GT09E.

50	50 AGP50 FPGP5052028		80	225	213	663	

When neither bar can be rotated (or if both bars would be a burden to rotate, for example because of their size, shape or length), the GRIPTEC® Position splice system uses a "Position stud assembly" set combined with standard male and female sleeves.

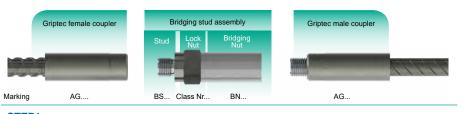

### Dimensions of the position stud assembly:

	Approximate dimensions (mm)										
L2	L4	L5	е	S	m						
60	26	48	23	21	13

28	AGB28	FPGB2830008	44.5	105	205	415	44
30,32	AGB32	FPGB3233008	50	140	220	500	44
36	AGB36	FPGB3639008	56	143	240	526	45
40	AGB40	FPGB4042008	64	170	254	594	47
50	AGB50	FPGB5052008	80	225	306	756	47

When the bars cannot be brought butt to butt (as it happens often in cages manufacturing), GRIPTEC® Bridging Splices are the answer. This is a variant of the position splice that uses a longer stud and a longer nut. Gaps between bar ends can be bridged by this system.

### Dimensions of the bridging stud assembly

	Approximate dimensions (mm)										
L3	L4	L5	е	S	m						
96	59	84	23	21	13						
102	61	88	27	24	15

207	117	172	71	65	33						
259	143	211	88	80	41						

Table 4: Griptec AGB Bridging splices & Lock nuts

Note: Ordering information for the bridging stud assembly / The table gives the product codes to mention in your purchase orders. Please note that the male and female sleeves have to be ordered separately.

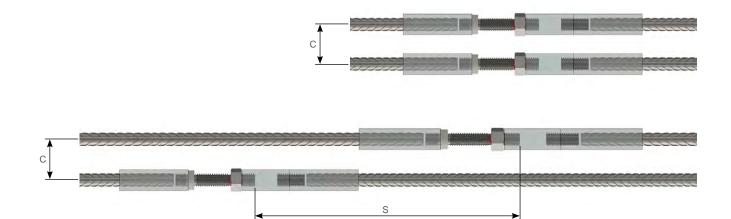

### **Connection of bundled bars**

### **Connection of bundled bars**

To connect bundled bars with this system, a minimum spacing should be maintained between the bar ends in order to accommodate the thickness of the coupler, and the bar ends should be staggered so that the movement of the bridging couplers is not obstructed by the neighbouring bar.

The minimum values for spacing and staggering are given in table 4. The spacing "c" is the centre-to-centre value. The staggering length "s" is from bar end to bar end.

There is no need to stagger the bars if the centre-to-centre spacing is more than both the diameter of the couplers and the dimension of the lock nut.

Bar size	Min. bar spac	cing C (mm)	Min.bar Staggering
Dar Size	No Staggering	Staggering	S (mm)
12	28	23	277
14	32	25	307
16	35	28	352
20	42	34	389

50	93	74	758

## **Headed Bars**

Development or anchorage of reinforcement is the main use of headed bars. They conveniently replace hooked bars as end anchorages in congested areas. They can also be used to reduce lapping length, or as confinement or shear reinforcement where placing of stirrups is difficult.

Typical applications include exterior beam-column connections, roof corners, pile feet, pile caps, cantilevered members, corbels, etc.

Headed bars can provide full design anchorage by either the head bearing alone or a combination of the head bearing together and rebar bond. The selection of approach will primarily depend on the design standard adopted, the size of the head and the strength of concrete.

Standard GRIPTEC® mechanical anchorages are circular in shape and are fixed to the end of the rebar by screwing them onto the end of the male GRIPTEC® sleeve. Two sizes of heads are available:

- Small heads, with a net bearing area greater than or equal to four times the crosssection area of the reinforcing bar (4A).
- Large heads, with a net bearing area greater than or equal to nine times the cross section area of the reinforcing bar (9A).

When loaded in tension and due to the round shape of the head, a cone of overstressed concrete will develop immediately under the head. If the head is large enough and the concrete is strong enough, the full anchorage design strength can be developed via the head alone. If this is not the case, then a contribution of rebar bond is required, immediately beyond the region of overstressed concrete.

Different codes of practice take different design approaches. Some, for example ACI 318, explicitly allow for a 4A head with a provision for a load contribution to be taken via rebar bond. Others, for example, fib Model Code 2010, give a set of simplified prescriptive rules for a minimum head size of 8A only. EN1992-1-1 (Eurocode 2), does not explicitly cover designing with headed bars. However, rules can be derived from the provisions for partially loaded areas. For further information on how to design in accordance with Eurocode 2, please see the Arup/ Dextra Design Guide.

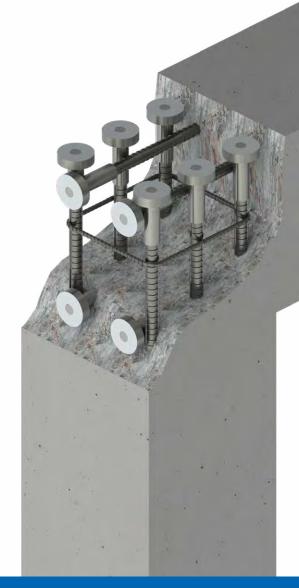

In beam-column connections, headed bars in beam reinforcement should extend to the far side of the column core. In roof corners, the column heads should be located above the beam bars. In both cases this detailing arrangement will provide space for an additional layer of transverse reinforcement, which will further improve the capacity of the anchorage.

Headed bars can be arranged close to one another: Tests have shown that the overlapping of compression cones does not reduce the effectiveness of the anchorage. However, the relevant code of practice should be followed with regards spacing.

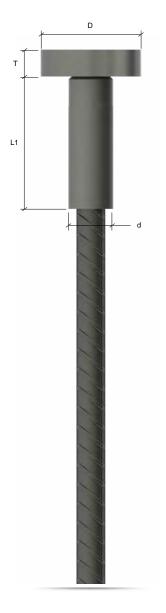

For applications in seismic design, or whenever stress reversal can be expected, the anchorage length in compression should be checked too. (Just like hooks, headed bars do not contribute to anchorage in compression, which must therefore be provided by a straight portion of bar as per the code requirement).

Full-scale cyclic tests of beam-column connections reinforced with headed bars have shown that push-out of the concrete behind the head does not occur until a drift ratio of 6%.

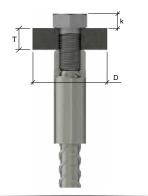

Standard Griptec anchor plates are circular, and are fixed to the bar end by screwing them onto male sleeve.

See Assembly instruction n° AI-GT14E.

For applications where the Griptec sleeve must be a female, it is possible to fix the end anchor plate with a hexagonal head screw

### Small size Headed bars

# Weldable Couplers

For composite construction where concrete reinforcement bars must be welded to structural steel, GRIPTEC® weldable couplers are available. This is a nut made of weldablegrade steel that bears a large chamfer suitable for single bevel butt welding.

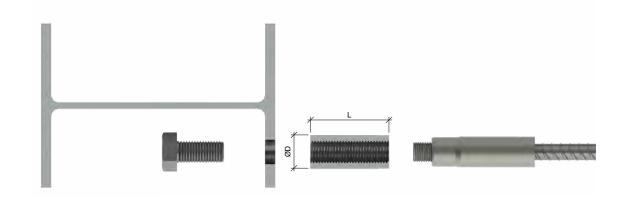

See Assembly instruction n° AI-CW01E.

### **Connection to Structural Steel**

For composite construction where structural steel must be bolted to concreate reinforcement bars, GRIPTEC bridging nuts are available. These nuts are long enough to accommodate the Griptec male sleeve on one end and a standard bolt on the other end. The tables below indicate which bolt length and standard ISO-designation should be used, depending on the thickness of the structural steel (the 3 ranges of thickness are presented in 3 columns) and whether or not a washer is used (2 options presented in 2 separate tables).

		Bridging nut det	tails		Bolt details (as per ISO 4017 : 2014) without washer

# **Pocket Formers**

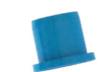

Pocket Formers are plastic accessories that fit the threads of male Griptec® sleeves in order to form a reservation in the concrete. They can be nailed to a wooden formwork through the holes in their flange.

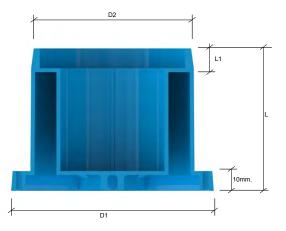

It is advisable to apply a mould-release agent to the pocket formers prior to concreting. Simply use the same agent as for the formworks.

Simple extraction tools are available on request

Table 11: Dimensions of Griptec Pocket Formers

# **Nailing Plate**

Nailing Plates are plastic accessories that are used to fix female Griptec couplers on timber formwork. This is done by nailing the plate to the formwork at the desired location and then screw the coupler onto the plate.

After removing the formwork, the nailing plate is unscrewed, leaving a 10 to 12 mm deep recess between the concrete surface and the female coupler.

## **Thread Protection Cap Remover**

The TPC Remover removal tool is used to remove the thread protection cap from the protruding and obstructed bars in masonry wall construction. It is compatible with Griptec caps, for bar sizes from 12-20mm. Only 3 working steps for cap removal.

See Assembly instruction n° 23: Griptec Assembly Instruction TPC Remover

Table 13 : Dimensions of TPC Remover for Griptec thread

### **Stainless Steel Connectors**

Stainless steel connectors are available for future extensions : their blind holes prevent water ingress and their material prevents corrosion to occur, thereby maintaining the reinforcement in good condition until the day the extension is built.

# **Colour Identification**

The plastic caps that protect the threads of GRIPTEC® couplers are coloured to enable a quick identification of the bar size and prevent miss-matching of threads.

Bar size	Thread size	Product code	Colour
12	M14x2.0	GMEC0002832	Yellow

50	M52x5.0	GMEC0002845	Grey

Table 15: Colour of plastic caps

Contrary to taper threads, no torque wrench is necessary. Connections on site must be done as per the correct Assembly Instruction, as referenced in this document for each type of splice. They are available upon request or at <u>www.dextragroup.com/downloads</u>

## **Custom Code**

The usual international customs code for mechanical couplers and anchor plates is 73.08.90.90.00-7 ("Parts of structures, of iron or steel").

However, national preferences may be followed.

# Quality Assurance

Griptec® couplers and anchor plates are manufactured according to strict technical specifications and under a process that has been certified in accordance with the provisions of the ISO 9001, ISO 19443 quality management system standards, and the ASME Boiler and Pressure Vessel Code.

They are warranted to be free from manufacturing defects and to perform in accordance with the manufacturer's specifications providing that they are installed in accordance with the manufacturer's instructions.

All load-bearing elements are individually marked. Full traceability of the production batches and raw material lots is guaranteed. Sleeve studs are marked on their face, either outside or inside the sleeve.

The retention period of our quality records is 12 years.

Table 16: Quality assurance

# Approvals

Griptec® splices have received the following approvals:

Country	Agency	Certificate N°	Details
0	ASSOCIATION FRANÇAISE DE CERTIFICATION DES ARMATURES DU BÉTON	N° M02/004	For standard, position, bridging, transition & position- transition splices and anchorages in dia 12 through 40. For standard fatigue in dia 12 through 32. For Standard, position seismic in dia 12 through 40.
	CARES ECONICAL TECONICAL SOGS	N° 5005 for BS 8110 and Eurocode 2 applications.	For standard, position & transition splices in dia 12 through 50. For position-transition splices in dia 12 through 40. For bridging splices in dia 16 through 50. For caging splices in dia 32 through 50.
	CARES TECHNICAL STI4	N° 5014 for Sellafield applications.	For standard & position splices in dia 12 through 50. For transition & bridging splices in dia 16 through 50. For caging splices, bridging transition, and weldable in dia 32 through 40.
		N° 5051 for Highways Agency applications.	For standard splices in dia 12 through 40. For position splices in dia 12 through 50. For caging splices in dia 40 and 50.
		N° 5059 for applications BS 8110, Eurocode 2	For small anchors bars in dia 16 through 40mm. For large anchors bars in dia 16 through 32mm, and Bolted Headed bars in dia 32 through 40.
		N° 5059 for applications Sellafield.	For small anchors bars in dia 16 through 40mm. For large anchors bars in dia 16 through 25mm, and Bolted Headed bars in dia 32 through 40.
	Deutsches Institut für Bautechnik	N° Z-1.5-133	For standard, position, bridging, transition & position- transition splices, anchorages, weldable, stainless steel connectors, and steel connectors in dia 12 through 40.
		R-2.1.9-19-16718	For standard splices in dia 12 through 36
<b>F</b>	Roads & Maritime Services	№ SF2016/39582	For standard splices in dia 12 through 40.

# **Changes and Updates**

As a result of our continuous thrive for technological improvement, Dextra reserves its right to modify the contents of this specification sheet at any time without prior notice.

# Disclaimer

Dextra products are warranted to be free from defects in material and workmanship at the time of delivery. No other warranty, whether expressed or implied shall exist in the connection of the sale, lease or use of any Dextra products. This warranty is limited to the original value of the products/ services.

Dextra shall in no event be responsible if the products have not been stored or used in accordance with its specifications and recommended procedures / instructions.

Dextra is not responsible for any direct or consequential losses or damages of any kind that maybe incurred by the Buyer/User of its products.

PACKING DETAILS

# Packing details

Pocket formers are packed in carton boxes. Other products are packed in wooden crates that can be lifted by a forklift.

All products must be stored under a roof and protected from the elements.

Please ensure that order quantities are a multiple of the packaging quantities stated in the following tables.

Devisione	Inside	Outside	
Box type	W x L x H (cm)	W x L x H (cm)	– Weight (kg)
1	36.6x56.6x25.0	43.4x63.4x43.7	17
2	56.6x76.6x29.0	63.4x83.4x47.7	25
3	76.6x116.6x29.0	83.4x123.4x47.7	39
4	76.6x116.6x45.0	83.4x123.4x63.7	48
